The Quick-Mount On-board Camera accessory mounting system incorporates the elements of speed, ease, ergonomics and modularity for attaching on-board monitors, electronic measuring devices and practically any and all camera accessories using Israeli style articulating arms for attachment and positioning on a wide variety of Motion Picture Cameras.

The unique Yoke Bracket Assembly, with or without the Quick-Release Yoke Bracket Accessory Module Can be adjusted along a basic X/Y and Z axis configuration to fit on almost any Transvideo style on-board camera monitor.

This design keeps the monitor fastened steady to the arm and prevents loosening due to excessive handling. It also places the arm horizontally to the monitor for added length from the camera mounting point and greater ease in flipping the monitor from one side of the camera to the other.

The Star Mount Assembly in conjunction with the Knuckle Mount or Barrel Mount (designed to be attached directly to all newer Arri Style Cameras) makes attaching and detaching the entire monitor and arm to and from the camera fast and easy. The Knuckle Mount or Barrel Mount may be permanently attached to the camera for repeated use and the Star Mount may also be attached to any 3/8-16 threaded accessory hole without the Knuckle or Barrel Mount if needed. While allowing greater ease of operation than with traditional mounts, the Star Mount assembly eliminates the need to over-tighten the articulating arm, using it to "torque" itself down into the accessory hole, preventing potential damage to the articulating arm.

With the Square Post Mount Adapter, the Quick Mount can be used with more traditional cameras with 14mm square accessory ports.
